

# CS453 - Project Proposal

Team Members: Chase Jamieson & Vuochlang Chang

We will be making a Pokemon Team builder web app. The Pokemon data will be scraped from PokeApi. (Consumption-only api) From this, we will implement a database for all Pokemon where users will be able to search for a Pokemon and add it to their team (max 6 Pokemon). Users can update their team by removing or adding Pokemon that they see fit. To access their team, login using OAuth2 will be required. We will implement this using a Javascript frontend, Node and Express backend.
